

Phase 4 Summary: Process Automation

Project: SmartCare CRM – Healthcare Appointment & Patient Tracking System

This phase makes the healthcare application functional by automating key business processes for managing patient appointments and doctor notifications.

Validation Rule: Future Appointment Date Required

Purpose: To ensure data quality by preventing users from creating appointments in the past.

How it Works: The rule's formula checks if the Appointment Date/Time is earlier than today. If this condition is met, an error message appears, and the user cannot save the record until a valid future date is selected.

The screenshot shows the Salesforce Setup interface for the 'Appointment' object. The left sidebar contains a navigation menu with options: Details, Fields & Relationships, Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, and List View Button Layout. The main content area is titled 'Appointment Validation Rule' and includes a 'Back to Appointment' link. Below the title is a 'Validation Rule Detail' section with a table of configuration details. The table includes fields for Rule Name, Error Condition Formula, Error Message, Description, Created By, and Modified By, along with an 'Active' checkbox. The 'Error Condition Formula' is set to 'Appointment_DateTime_c < NOW()'. The 'Error Message' is 'Appointment date/time cannot be in the past.' The 'Error Location' is 'Appointment DateTime'. The 'Created By' and 'Modified By' are both 'Hospital Admin' with timestamps of '9/25/2025, 3:10 AM'. There are 'Edit' and 'Clone' buttons for the rule details.

Validation Rule Detail	
Rule Name	Appointment_Not_In_Past
Error Condition Formula	Appointment_DateTime_c < NOW()
Error Message	Appointment date/time cannot be in the past.
Description	
Created By	Hospital Admin: 9/25/2025, 3:10 AM
Modified By	Hospital Admin: 9/25/2025, 3:10 AM
Active	☒

Flow: Doctor Assignment Notification

Purpose: To notify doctors when they are assigned to an appointment.

How it Works: This record-triggered flow runs whenever the Assigned Doctor field changes on an Appointment record. It performs two actions:

- Sends an email notification to the newly assigned doctor with appointment and patient details.
- Posts a message to the appointment's Chatter feed so the doctor can view assignment in Salesforce.

Approval Process: Appointment Request Approval

Purpose: To implement a formal approval workflow for patient appointment requests.

How it Works: The approval process can be started for any appointment where the Status is 'Requested'. When submitted:

- The approval request is automatically routed to the assigned doctor.
- If approved, the Status updates to 'Confirmed'. If rejected, it updates to 'Cancelled'.
